

Process & Decision Documentation

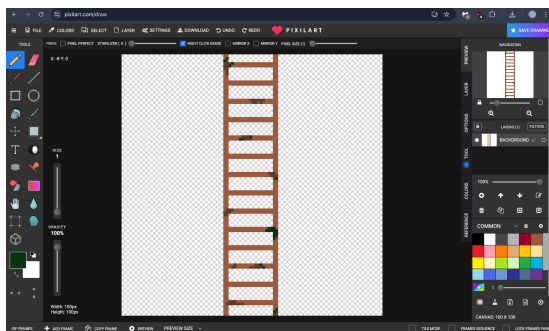

Project/Assignment Decisions

The decisions I made were to split the 3 game mode sections, easy, medium, and hard,d into 3 JavaScript files. I made this decision to make it easier to work on each section of the game; in the end, it made it easier to keep track of what I wanted to display on each game mode section.

Role-Based Process Evidence

Made commitments 161 times. The commitments include mostly debugging, updating parameters, and testing. Included screenshots of creating graphics.

In this code, I updated the y position of where the crown image would load.

```

In the easy level, when the mouse presses the button less than or equal to 3 times, it switches to the next level. randomBg was created so whenever the button was pressed, the background would change to a random colour. It was also created so I could use it in the buttonOpacity function because I wanted the background colours to be the same, but with a different opacity, so players would be able to see the actual button instead of it blending exactly with the background.

```

function easyMousePressed() {
  if (isHover(gameBtn)) {
    easyClicks++;
    randomButton(); // randomizes button position once mouse is clicked
    randomBg = color(random(0, 255), random(0, 255), random(0, 255)); // randomize

    if (easyClicks >= 3) {
      easyClicks = 0;
      currentScreen = "medium";
    }
  }
}

function randomButton() {
  gameBtn.w = random(5, 150); // random button width
  gameBtn.h = random(5, 150); // random button height
  gameBtn.x = random(gameBtn.w / 2, width - gameBtn.w / 2); // random x position
  gameBtn.y = random(gameBtn.h / 2, height - gameBtn.h / 2); // random y position
}

function buttonOpacity(opacity) {
  return color(
    red(randomBg) * 0.5,
    green(randomBg) * 0.5,
    blue(randomBg) * 0.5,
    opacity,
  );
}

```

In the [medium.js](#) file, I added an image and created a circle, which led to two different outcomes. Using mouseX and mouseY to track the mouse's position, so whenever it is pressed between those parameters, using the if function, if the player presses on the circle, it would bring them to the lose screen, and if they select the ladder, it would bring them to the win screen. Used dist because I wanted the hitbox to be for the circular

hitbox, and the other was used since it just needs a rectangular hitbox.

```
1 function drawMedium() {
2   background("white");
3
4   // instructions
5   fill(0); // black text
6   textSize(32);
7   textAlign(CENTER, CENTER);
8   text("Congrats, you have unlocked the White Room", width / 2, 160);
9
10  textSize(18);
11  text("Two paths lie ahead..", width / 2, 200);
12  text("Will you climb the ladder or descend into the hole?", width / 2, 230);
13
14  fill("black");
15  circle(500, 450, 150);
16
17  image(ladderImg, 100, 280, 400, 400);
18 }
19
20 function mediumMousePressed() {
21   if (dist(mouseX, mouseY, 500, 450) < 75) {
22     currentScreen = "lose";
23   }
24
25   if (mouseX > 260 && mouseX < 340 && mouseY > 280 && mouseY < 680) {
26     currentScreen = "hard";
27   }
28 }
```

In the hard level, I added 5 images of the crown and used the if function to detect if the player selected the parameters of, correct crown it would bring them to the win screen, if they clicked on the parameters of the other crowns they would be brought to the lose screen.

```
function drawHard() {
  background(134, 221, 247); // light blue

  // title
  fill(0); // black text
  textSize(32);
  textAlign(CENTER, CENTER);
  text("You made it to the sky!", width / 2, 160);

  textSize(18);
  text("Click on the correct crown to find...", width / 2, 210);

  image(crownImg, 200, 280, 50, 50); // click to win
  image(crownImg, 400, 500, 100, 100);
  image(crownImg, 0, 400, 505, 505);
  image(crownImg, 0, 100, 100, 100);
  image(crownImg, 100, 0, 700, 700);
  image(crownImg, 500, 340, 505, 505);
}

function hardMousePressed() {
  if (mouseX > 220 && mouseX < 228 && mouseY > 296.5 && mouseY < 304) {
    currentScreen = "win";
  } else if (
    (mouseX > 438 && mouseX < 456 && mouseY > 533 && mouseY < 549) ||
    (mouseX > 192 && mouseX < 283 && mouseY > 567 && mouseY < 647) ||
    (mouseX > 38 && mouseX < 56 && mouseY > 133 && mouseY < 149) ||
    (mouseX > 366 && mouseX < 492 && mouseY > 231 && mouseY < 343) ||
    (mouseX > 693 && mouseX < 783 && mouseY > 507 && mouseY < 587)
  ) {
    currentScreen = "lose";
  }
}
```

Entry Header

Name: Katrina Huang

Role(s): Designer & Programmer

Primary responsibility for this work: Designed graphics, debugged code, and created code

Goal of Work Session

To create multiple game states through JavaScript files

Tools, Resources, or Inputs Used

ChatGPT 5.2

GenAI Documentation

GenAI was used for Side Quest 3.

If GenAI was used (keep each response as brief as possible):

Date Used: January 31

Tool Disclosure: ChatGPT 5.2

Purpose of Use: I used GenAI to debug my code

Summary of Interaction: Support tool to debug code

Human Decision Point(s): Modified code when I noticed it had the wrong input

Integrity & Verification Note: Used my past knowledge from previous courses and tested if the code worked.

Scope of GenAI Use: Creating graphics, images, shapes

Limitations or Misfires: Debugged the wrong area of code and gave tips that didn't work

Summary of Process (Human + Tool)

- Tested and made updates to the code
- Created graphics
- Debugged code

Decision Points & Trade-offs

- The options I considered were to keep everything on the game page or to split it up into multiple JavaScript files. I decided to split it up into multiple files to make everything easier.
- The options I considered were to use graphics online or create my own. I decided I wanted to create my own for practice to use for future assignments.

Verification & Judgement

I evaluated whether my judgment was appropriate based on the future asks of this course and how it would help me improve my JavaScript skills.

Appendix

Prompt 1:

Why does the start screen freeze when I press the start button? *Attached code*

ChatGPT 5.2:

Ah! I see exactly what's happening — the start screen “freeze” isn't a p5.js problem; it's a logic/load problem in how your mouse clicks are being routed.

Here's why your START button isn't working:

① The `startMousePressed()` coordinates are redefined each draw call

In your `drawStart()` you define:

```
const startBtn = { x: width / 2, y: 320, w: 240, h: 80 };
```

But in `startMousePressed()` you redefine them again. This isn't inherently wrong, but if `startMousePressed()` runs before the mouse is over the button (or `isHover()` fails), it will never change `currentScreen`.

✓ Fix: define `startBtn` and `instrBtn` globally in `start.js` so they are the same object for drawing and hover checks.

② Make sure `isHover()` is called correctly

Right now, in `startMousePressed()`:

```
if (isHover(startBtn)) {  
  currentScreen = "easy";  
}
```

- `isHover()` uses `mouseX` and `mouseY`.
 - Make sure your button coordinates match `rectMode(CENTER)` (which they do).
 - Also, ensure your canvas isn't inside a container that offsets mouse coordinates. If it is, `mouseX/mouseY` might not match the visible button.
-

③ Use global buttons in `start.js`

// start.js

```
const startBtn = { x: 400, y: 320, w: 240, h: 80, label: "START" };
```

```
const instrBtn = { x: 400, y: 430, w: 240, h: 80, label: "INSTRUCTIONS" };
```

```

function drawStart() {
    background(180, 225, 220);
    fill(30,50,60);
    textSize(46);
    textAlign(CENTER, CENTER);
    text("Win or Lose", width/2, 180);

    drawButton(startBtn);
    drawButton(instrBtn);

    cursor(isHover(startBtn) || isHover(instrBtn) ? HAND : ARROW);
}

function startMousePressed() {
    if (isHover(startBtn)) {
        currentScreen = "easy"; // This switches screens
    } else if (isHover(instrBtn)) {
        currentScreen = "instr";
    }
}

```

Now the same objects are used for drawing and hover detection. This eliminates a common “button doesn’t respond” bug.

4 Make sure `easy.js` exists

`main.js` routes to `drawEasy()` when `currentScreen === "easy"`. If `drawEasy()` is missing or has an error, it looks like the screen froze.

For testing, make a minimal `easy.js`:

```
function drawEasy() {  
  background(200);  
  textSize(32);  
  textAlign(CENTER, CENTER);  
  text("Easy Mode", width/2, height/2);  
}
```

```
function easyMousePressed() {  
  console.log("Clicked in easy");  
}
```

If this works, then the start button is functional and the problem was in your `drawEasy()` logic.

If you want, I can rewrite a ready-to-drop `start.js` + `easy.js` pair that fixes the freeze and will let you transition smoothly to Easy → Medium.

Do you want me to do that?

Prompt 2:

My code is still stuck on the start screen *Attached code*

ChatGPT 5.2:

You're stuck because **your easy screen is constantly forcing the screen state back**, and your click logic is wrong.

Here are the **only two problems** and the **exact fixes**.

PROBLEM 1: You reset the screen every frame

This line **locks you on easy forever**:

```
currentScreen = "easy";
```

`drawEasy()` runs **every frame**, so even if you change screens on click, it immediately snaps back.

FIX

DELETE this line from `drawEasy()`

```
currentScreen = "easy";
```

Screens should change **only in mouse/keyboard handlers**, never inside draw functions.

PROBLEM 2: Your click condition is backwards

You wrote:

```
if (easyClicks < 3) {  
    easyClicks = 0;
```

```
currentScreen = "medium";  
}
```

That means:

- On **first click**, `easyClicks === 1`
- `1 < 3` → true
- It immediately jumps (or breaks logic)

You want **3 clicks**, not less than 3.

✓ FIX

Change it to:

```
if (easyClicks >= 3) {  
  easyClicks = 0;  
  currentScreen = "medium";  
}
```

✓ FINAL corrected `easyMousePressed()`

```
function easyMousePressed() {  
  if (isHover(gameBtn)) {  
    easyClicks++;  
    randomButton();  
    randomBg = color(random(255), random(255), random(255));  
  
    if (easyClicks >= 3) {
```

```
    easyClicks = 0;
    currentScreen = "medium";
  }
}
}
```

✅ FINAL rule (important)

- `drawEasy()` → draw only
- `easyMousePressed()` → change screens
- **Never** set `currentScreen` inside a draw function

If you want, I can next:

- wire up `medium` → `hard`
- add clickable ladder / hole
- sanity-check `main.js` screen switching

Prompt 3:

After the win screen, when I press start again it goes straight to hardmode. How do I fix this?

ChatGPT 5.2:

Ah! I see exactly what's happening. The problem is that your **mode flags** (`titleEasy`, `titleMedium`, `titleHard`) aren't being reset properly when the game restarts.

Right now, when you win and start again:

- `buttonClicks` is reset to 0

- But `titleHard` (or `titleMedium`) may still be `true` from the previous round
- Your `drawGame()` function checks the flags in this order:

```
if (titleEasy) { ... }
```

```
if (titleMedium) { ... }
```

```
if (titleHard) { ... }
```

Because `titleHard` is still `true` from last time, Hard mode is drawn immediately, even though `buttonClicks` is 0.

How to fix it

You need to **reset all mode flags when the game starts**, like this:

```
function startGame() {  
  currentScreen = "game";
```

```
  // Reset counters
```

```
  buttonClicks = 0;
```

```
  totalClicks = 0;
```

```
  levelText = false;
```

```
  // Reset mode flags to Easy
```

```
  titleEasy = true;
```

```
  titleMedium = false;
```

```
  titleHard = false;
```

```
  // Reset button opacity
```

```
    opac = 120;  
}
```

Then, instead of just setting `currentScreen = "game"` when pressing Start, call:
`startGame();`

Additional fixes

1. Remove this line from `drawGame()`:

```
let titleMedium = false;  
let titleHard = false;
```

Right now, you are **declaring local variables inside `drawGame()`**, which are shadowing the global flags. That's why some modes behave weirdly. Use the global variables only.

2. Make your mode logic based on `buttonClicks` **only** inside `gameMousePressed()` — don't touch them in `drawGame()`.

✓ Summary:

- Global flags (`titleEasy`, `titleMedium`, `titleHard`) must be reset when starting a new game.
- Don't declare local variables with the same names inside `drawGame()`.
- Use `buttonClicks` to update the flags.

If you want, I can rewrite your `gameMousePressed()` and `drawGame()` so that **Easy** → **Medium** → **Hard works perfectly** and it always starts in Easy mode after restarting.

Do you want me to do that?

Prompt 4:

Is the button opacity fine? *Attached code*

ChatGPT 5.2:

Ah — I see exactly what's happening with your button opacity. Right now you have:

```
fill(buttonOpacity(10));
```

The problem is **the opacity is extremely low**. In p5.js, the alpha (opacity) value ranges **0–255**, where 0 is fully transparent and 255 is fully opaque. You're using **10**, which is basically invisible. That's why the button is almost impossible to see.

✅ How to fix it:

If you want the button to **match the background color but still be visible**, use a higher alpha, like **150–200**:

```
fill(buttonOpacity(180)); // much more visible
```

And your `buttonOpacity()` function is fine:

```
function buttonOpacity(opacity) {  
  return color(  
    red(randomBg) * 0.5, // darker than background  
    green(randomBg) * 0.5,  
    blue(randomBg) * 0.5,  
    opacity              // controls transparency  
  );  
}
```

```
}
```

So basically:

- Keep the RGB multiplication (`* 0.5`) so the button is slightly darker than the background.
- Increase the alpha to **150–200** so the button is actually visible.

If you want, I can rewrite your `drawGameButton()` so the **opacity changes depending on difficulty** automatically, e.g., easy = 200, medium = 120, hard = 50.

Do you want me to do that?

Prompt 5:

Is my code making the GitHub page stuck on the loading screen? *Attached code*

ChatGPT 5.2:

Ah — I can already spot a **major reason your GitHub Pages canvas stays stuck on “Loading...”** just from this `main.js`:

1. You’re loading an invalid image

```
crownImg = loadImage("libraries/images/.png");
```

- There is **no filename** before `.png`.
- p5.js **throws an error** when `loadImage()` can’t find a file, and this **stops the sketch from running** → canvas never appears → “Loading...” stays forever.

✓ Fix this:

```
crownImg = loadImage("libraries/images/crown.png"); // actual filename
```

- Make sure the file exists in that exact path.
 - GitHub Pages is **case-sensitive**: `Crown.png` \neq `crown.png`.
-

2. Optional: handle missing images safely

For testing, you can **comment out** `crownImg` temporarily to confirm the canvas loads:

```
// crownImg = loadImage("libraries/images/crown.png");
```

- If the canvas loads now, the problem is definitely that missing image.
-

3. Other image paths

Check all other `loadImage()` calls:

```
ladderImg = loadImage("libraries/images/ladder.png");
```

```
orangeImg = loadImage("libraries/images/orange.png");
```

- Make sure all these files exist at **exact case-sensitive paths**.
 - Any missing file will freeze p5.js during `preload()`.
-

4. Preload must finish before setup()

- p5.js **waits for** `preload()` to finish.
 - If an image fails to load, `setup()` never runs, and the canvas never initializes.
-

5. Next step

After fixing the filename:

1. Push changes to GitHub.
2. Refresh your GitHub Pages URL with a **hard refresh** (Ctrl+Shift+R / Cmd+Shift+R).
3. You should see your canvas now.

💡 **Tip:** For debugging, you can wrap `loadImage()` in a try/catch with `console.log` to see which file is missing:

```
function preload() {  
  try { ladderImg = loadImage("libraries/images/ladder.png"); }  
  catch (e) { console.error("ladderImg failed", e); }  
  
  try { crownImg = loadImage("libraries/images/crown.png"); }  
  catch (e) { console.error("crownImg failed", e); }  
  
  try { orangeImg = loadImage("libraries/images/orange.png"); }  
  catch (e) { console.error("orangeImg failed", e); }  
}
```

If you want, I can **rewrite your `preload()` safely** so that **even if an image is missing**, the game still loads and shows a placeholder — this will stop “Loading...” forever on GitHub Pages.

Do you want me to do that?

Prompt 6:

Give me the hitboxes for each crown. In the PNGs, the size is 100x100, but the actual coordinates of where the crown is are from x38 to x56 and y 33 and y49.

```
image(crownImg, 400, 500, 100, 100);  
image(crownImg, 0, 400, 505, 505);  
image(crownImg, 0, 100, 100, 100);  
image(crownImg, 100, 0, 700, 700);  
image(crownImg, 500, 340, 505, 505);
```

ChatGPT 5.2:

Here are **simple hitboxes** for each of those crowns.
If the player clicks **any of these**, send them to "lose".

```
function hardMousePressed() {  
    // WIN crown  
    if (  
        mouseX > 200 && mouseX < 250 &&  
        mouseY > 280 && mouseY < 330  
    ) {  
        currentScreen = "win";  
    }  
  
    // LOSE crowns  
    else if (  
        // crown at (400, 500, 100, 100)  
        (mouseX > 400 && mouseX < 500 && mouseY > 500 && mouseY < 600) ||  
  
        // crown at (0, 400, 505, 505)
```

```

(mouseX > 0 && mouseX < 505 && mouseY > 400 && mouseY < 905) ||

// crown at (0, 100, 100, 100)
(mouseX > 0 && mouseX < 100 && mouseY > 100 && mouseY < 200) ||

// crown at (100, 0, 700, 700)
(mouseX > 100 && mouseX < 800 && mouseY > 0 && mouseY < 700) ||

// crown at (500, 340, 505, 505)
(mouseX > 500 && mouseX < 1005 && mouseY > 340 && mouseY < 845)
){
  currentScreen = "lose";
}
}

```

Key rule (remember this forever):

For `image(img, x, y, w, h)`

👉 hitbox is always:

- $x \rightarrow x + w$
- $y \rightarrow y + h$

If you want this **cleaner or loop-based later**, I can refactor it — but this works **right now**.

Prompt 7:

How should I separate the [main.js](#) file into 3 different files, like easy, medium, and hard.

Attached code

ChatGPT 5.2:

Great question — this is **exactly** the moment your project turns from “one big sketch” into a *real multi-screen interactive story*. 🙌

You already have the right architecture in `main.js`. Now we just **lean into it**.

🔑 Big idea (important mindset shift)

Right now you’re doing this **inside one screen**:

```
if (titleEasy) { ... }  
if (titleMedium) { ... }  
if (titleHard) { ... }
```

That works, but it’s fighting your system.

👉 **Instead:**

Each *mode* becomes its **own screen** with its **own file**.

So you go from this:

```
game.js  
├── Easy mode  
├── Medium mode  
└── Hard mode
```

to this:

```
easy.js  
medium.js
```

hard.js

And you switch between them using:

```
currentScreen = "medium";
```

Step 1: Decide your screens

Based on your story, you probably want:

start

easy

medium

hard

win

lose

So your `currentScreen` values will be strings like:

"easy", "medium", "hard"

Step 2: Create new files

Create **three new files**:

easy.js

medium.js

hard.js

Make sure they are loaded in `index.html` **after** `main.js`.

easy.js (Easy Mode screen)

Move **ONLY Easy content** here.

```
function drawEasy() {  
    background(240, 230, 140);  
  
    fill(0);  
    textSize(32);  
    textAlign(CENTER, CENTER);  
    text("Find Me - EASY MODE", width / 2, 160);  
  
    textSize(18);  
    text("Find the button 3 times to unlock the door.", width / 2, 210);  
  
    fill("white");  
    rect(width / 2, 760, 80, 120);  
    fill("black");  
    rect(375, 755, 5, 10);  
  
    drawGameButton(gameBtn);  
    cursor(isHover(gameBtn) ? HAND : ARROW);  
}
```

```
}
```

```
let easyClicks = 0;
```

```
function easyMousePressed() {
```

```
  if (isHover(gameBtn)) {
```

```
    easyClicks++;
```

```
    randomButton();
```

```
    if (easyClicks === 3) {
```

```
      easyClicks = 0;
```

```
      currentScreen = "medium"; // 🔥 transition
```

```
    }
```

```
  }
```

```
}
```

medium.js (Decision screen)

This is your **branching moment** — no button clicks needed.

```
const hole = { x: 500, y: 450, r: 75 };
```

```
const ladder = { x: 100, y: 280, w: 400, h: 400 };
```

```
function drawMedium() {
```

```
  background(255);
```

```
fill(0);  
textSize(32);  
textAlign(CENTER, CENTER);  
text("The White Room", width / 2, 160);
```

```
textSize(18);  
text("Two paths lie ahead.", width / 2, 210);  
text("Climb the ladder or descend into the hole.", width / 2, 235);
```

```
// hole  
fill(0);  
circle(hole.x, hole.y, hole.r * 2);
```

```
// ladder  
image(ladderImg, ladder.x, ladder.y, ladder.w, ladder.h);  
}
```

```
function mediumMousePressed() {  
  // HOLE → lose / secret  
  if (dist(mouseX, mouseY, hole.x, hole.y) < hole.r) {  
    currentScreen = "lose";  
  }  
}
```

```
// LADDER → hard mode
```

```
if (  
  mouseX > ladder.x &&  
  mouseX < ladder.x + ladder.w &&  
  mouseY > ladder.y &&  
  mouseY < ladder.y + ladder.h  
) {  
  currentScreen = "hard";  
}  
}
```

hard.js (Skill challenge)

```
function drawHard() {  
  background(50);  
  
  fill(255);  
  textSize(32);  
  textAlign(CENTER, CENTER);  
  text("Find Me - HARD MODE", width / 2, 160);  
  
  textSize(18);  
  text("Find the button to win.", width / 2, 210);  
  
  drawGameButton(gameBtn);  
}
```

```
let hardClicks = 0;
```

```
function hardMousePressed() {  
  if (isHover(gameBtn)) {  
    hardClicks++;  
    randomButton();  
  
    if (hardClicks === 1) {  
      currentScreen = "win";  
      hardClicks = 0;  
    }  
  }  
}
```

Step 3: Update **main.js** router

Add these lines:

```
else if (currentScreen === "easy") drawEasy();  
else if (currentScreen === "medium") drawMedium();  
else if (currentScreen === "hard") drawHard();
```

And mouse routing:

```
else if (currentScreen === "easy") easyMousePressed();
```

```
else if (currentScreen === "medium") mediumMousePressed();
```

```
else if (currentScreen === "hard") hardMousePressed();
```

If you want, next I can:

- Help you add a **secret ending**
- Add **visual hover feedback** for ladder/hole

Just say the word 🌟👉
